This clone sequence is one of 5,000 Ceres full-length cDNAs made available to TIGR and Genbank. The following quality assessment of this set was done by comparison with known proteins: two percent this set was done by comparison with known proteins: two percent the clones are estimated to be 5'-truncated; less than one percent are 3'-truncated; approximately two percent represent alternative splice variants, including unspliced introns and spliced exons; one percent may contain premature stop codons; five percent may have frame shifts in a coding region. A sequence is considered to be 5'-truncated if it lacks the translation initiation start (ATG). A sequence is considered to be 3'-truncated if it lacks the crimial end of the encoded protein. Please note that these cDNA sequences are derived from the Ws or LAEr ecotypes and therefore may contain polymorphisms when compared to sequences from Colon Genset carried out the library production and sequencing of the full-length clones. Ceres, Inc. carried out the clustering of the full-length clones. Selection of clones, and sequence assembly.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                         652

```
Producing a modified, chimeric, or reconstructed DNA molecule of two parts comprises amplifying the two DNAs by PCR using primers incorporating recombination sites, ligating the PCR products, and then cloning the ligated products.
```

Disclosure, Fig 5, 15pp, English.

The invention relates to a novel method for producing a modified, chimeric, or reconstructed DNA molecule composed of 2 parts. The method comprises PCR amplification of each part using two primer sets that build in recombination sites at the outer ends of each PCR product, ligating the two PCR products and cloning the ligated products into a recombination vector. The method of the invention may be useful for the easy cloning and selection of chimeric DNA molecules. Unlike classical recombination methods the new method avoids the need for initial cloning using restriction enzymes and allows the production of mutated and/or chimeric DNA molecules. The current sequence is that of the plasmid production of mutanes and allows the modified rice thioredoxin H

The invention relates to a novel method for producing a modified, chimeric, or reconstructed DNA molecule composed of 2 parts. The method comprises PCR amplification of each part using two primer sets that build in recombination sites at the outer ends of each PCR product, ligating the two PCR products and cloning the ligated products into a recombination vector. The method of the invention may be useful for the easy cloning and selection of chimeric DNA molecules. Unlike classical recombination methods the new method avoids the need for initial cloning using restriction enzymes and allows the production of mutated and/or chimeric DNA molecules. The current sequence is that of the plasmid pDCNR201 of the invention which contains the rice thioredoxin H DNA. This sequence, located in figure 2, differs from that in the sequence listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        309

The transformed plant can control the intercellular transfer of a substance through the protoplasmic connections in the plant. The present sequence represents connections in the plant. The sequence is used in an example illustrating the method of the invention

Based on this partial amino acid sequence, a probe (AAC78206) was designed to screen for a sequence coding for the protein. A gene was cloned from the additionally variety of rice (AAC78206). By fusing the gene to a sequence coding for a second useful protein, the second protein will be transported to the sieve tube. (Updated on 16-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               t

```
The invention relates to a novel method for producing a modified, chimeric, or reconstructed DNA molecule composed of 2 parts. The method comprises PCR amplification of each part using two primer sets that build in recombination sites at the outer ends of each PCR product, ligating the two PCR products and cloning the ligated products into a recombination vector. The method of the invention may be useful for the easy cloning and selection of chimeric DNA molecules. Unlike classical recombination methods the new method avoids the need for initial cloning using restriction enzymes and allows the production of mutated and/or chimeric DNA molecules. The current sequence is that of the plasmid pDOURZOI of the invention which contains the rice thioredoxin H DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                            249

```
The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell production of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ1774) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MetAlaAlaGluGluGluGlyAlaValIleAlaCySHisThrLySASpGluPheAspAlaArg

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method (MI) for producing an oil body associated with a recombinant multimeric protein compiex (MPC). Multimeric protein compiex (MPC). Multimeric protein compies a first and second recombinant polypeptide (PI, P2), where PI is capable of associating with a p2 to form the MPC and associating the complex with an occlusion body (OB) through an OB-targeting-protein capable of associating with OB and PI. MI is useful for producing an oil body associated with a recombinant
                                                                                                                           240
                                                                                                                                                                                                                                                         300
                                                                                                                                                                                                                                                                                                                                                                301 GCGAATAAAGAACATCTTCAGGCGAAAATAGTGAAGCAT-----ACTGGTGTACAACT 354

Example 21; Fig 14; 69pp; English

The invention describes a method of expressing thioredoxin or thioredoxin reductase (1) in the oil body of a host cell using an oil body protein gene. The method involves introducing a chimeric nucleic acid comprising a first sequence to regulate transcription, a second DNA sequence encoding a fusion polypeptide, comprising a sequence encoding an oleosin gene and sequence encoding (1) and a third sequence encoding an oleosin termination region functional in the host cell and growing the host cell to produce a fusion polypeptide. The method or (1) is useful for expression of a thioredoxin or thioredoxin reductase by a host cell. This sequence encodes a oleosin oil body protein fused to Arabidopsis thaliana terminator sequence

New isolated polynucleotide encoding thioredoxin polypeptide is useful for producing transgenic plants with an altered level of thioredoxin.

Claim 3; Page 30-31; 33pp; English.

CDNA was derived from clone sfill.pk0029.e2, which was isolated from a cDNA library prepared from soybean immature flower. Chimeric genes encoding all or a portion of the thioredoxin protein, in sense or antisense orientation are constructed, wherein expression of the chimeric gene results in production of altered levels of the thioredoxin protein in a transformed host cell. Thioredoxin is involved in the disassembly of seed storage proteins during germination by reducing S-S bonds and in the bread making process. Over expression of thioredoxin in cereals may reduce the allergenicity of any transgenic protein engineered into cereal crops with high sulfhydryl content The present cDNA sequence encodes Glycine max thioredoxin protein. The

```
The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polymucleotides in the plant cell obtancteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (AB21219-AB217574) used in methods of the invention. Note: The sequence data for this patent is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                   168

complex Producing oil body associated with recombinant multimeric protein comple e.g. redox proteins and immunoglobulins comprises producing recombinant polypeptides capable of forming the complex in cells comprising oil bodies.

Claim 68; Page 197; 362pp; English.

The present invention describes a method (M1) for producing an oil body associated with a recombinant multimeric protein complex (MPC). M1 comprises producing in a cell comprising oil bodies at first and second recombinant polypeptide (P1, P2), where P1 is capable of associating with P2 to form the MPC and associating the complex with an occlusion body (MB is through an OB-targeting-protein capable of associating with OB and P1. M1 is useful for producing an oil body associating with OB and P1. M1 is useful for producing an oil body associating with a recombinant MPC. The oil bodies are further formulated for use in the preparation of a food product such as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface area of the human body or used to lighten the skin, or a pharmaceutical composition used to treat chronic obstructive pulmonary disease (COPD), cataracts, malighates, envenomation, bronchlopulmonary disease, psoriasis, malighancies, reperfusion injury, wound healing, sepsis, gastro intestinal (G1) bleeding, intestinal bowel disease (IBD), ulcers, GERD (Gastro oseophageal reflux disease). e.g. redox proteins and immunoglobulins comprises producing recombinant polypeptides capable of forming the complex in cells comprising oil bodies.

Example 2; Page 165-166; 362pp; English

The present invention describes a method (M1) for producing an oil body associated with a recombinant multimeric protein complex (MPC). M1 comprises producing in a cell comprising oil bodies a first and second recombinant polypeptide (P1, P2), Where P1 is capable of associating with CP P2 to form the MPC and associating the complex with an occlusion body (CP) through an OB-trageting-protein capable of associating with OB and P1. M1 is useful for producing an oil body associating with OB and P1. M1 is useful for producing an oil body associated with a recombinant MPC. The oil bodies are further formulated for use in the preparation of a food product such as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface area of the human body or used to lighten the Skin, or a pharmaceutical composition used to treat chronic obstructive pulmonary disease (CPDP), cataracts, diabetes, envenomation, bronchicopulmonary disease, psoriasis, malignancies, reperfusion injury, wound healing, sepsis, gastro (gastro oesophageal reflux disease). ARN89593 and ABP60677 to ABP60964 represent sequence given in the exemplification of the present invention

US-09-621-976-1844

Sequence 1844, Application US/09621976

Patent No. 6639063

GENERAL INFORMATION:

APPLICANT: Dumas Milne Edwards, J.B.

APPLICANT: Jobert, S.

TITLE OF INVENTION: ESTS and Encoded Human Proteins.

TITLE OF INVENTION: ESTS and Encoded Human Proteins.

TITLE OF INVENTION: ESTS and Encoded Human Proteins.

CURRENT PILING DATE: 2000-07-21

NUMBER OF SEQ ID NOS: 19335

SEQ ID NO 1844

LENGTH: 466
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              466

Sequence 103, Application US/08456265A

Patent No. 5767369

GENERAL INFORMATION:
APPLICANT: Alexander, Danny C.
APPLICANT: Ryals, John A.

APPLICANT: Stinson, Jeffrey R.
TITLE OF INVENTION: CHEMICALLY REGULATABLE AND ANTI-PATHOGENIC
TITLE OF INVENTION: DNA SEQUENCES AND USES THEREOF
NUMBER OF SEQUENCES: 111
CORRESPONDENCE ADDRESS:
ADDRESSER: CIBA-GEIGY Corporation
STREET: 520 White Plains Road, P.O. Box 2005
CITY: Tarrytown
                                         PAPLICATION NUMBER: US 07/329,018

PILING DATE: 24-MAR-1989

PRIOR APPLICATION NUMBER: US 08/045,957

PRIOR APPLICATION NUMBER: US 08/045,957
